

Asha Abdulkadir
Week 8 Research.

A list of commonly used MySQL queries other than creating and dropping tables and columns are: use database ~ use db1; , insert record ~ insert into customers values(101,'rahul','delhi'); , update record ~ update customers set name='bob', city='London' where id=101; , delete record ~ delete from customers where id=3; , select record ~ SELECT * from customers; , and truncate table ~ truncate table customers; .

Data is retrieved from a MySQL database by using the select query using the syntax: SELECT * from customers;

The WHERE clause is used to filter the result. Specifies the specific position where operation is done that is condition that must be fulfilled for the records to be selected.

Other MySQL clauses are: Distinct, from, order by, group by and having.
